

PRESERVE
your fertility

IVF PREGNANCY RATE BASED ON MATERNAL AGE

PRESERVING YOUR FERTILITY IS YOUR CHOICE

Why freeze your eggs?

- 1 You are a young woman who wants to live your life,** to study, to have an exciting career, traveling, find the right partner and have children.
- 2 We need to think about the biological clock.** A woman's peak of fertility is when she is around 25 years old. Your ovarian reserve decreases from year to year. How to fulfill your dreams and have a child at the right time?
- 3 The vitrification of your eggs gives you a better chance** of having children, using your eggs from when you were younger whenever you decide.

A PROCESS IN 4 STEPS

1 **Medical consultation***

You meet the medical team to discuss your plan and understand all the options available to you. You can make a thoughtful and informed decision.

2 **Egg collection and vitrification of your eggs**

The procedure itself takes between 12 and 14 days. It requires that you take injections to stimulate the ovaries, as well as vaginal ultrasounds and blood tests to determine the best moment to collect the eggs. The egg collection is a procedure that takes about 15 minutes. The eggs are then vitrified (frozen) and stored at the clinic in liquid nitrogen.

The results of each procedure vary from one patient to another, but the chance of success is higher in younger patients.

* medical consultation is free

3

A few years later, I want to become a mom

You can make an appointment at the clinic in order to consider your options. According to your age, and your ovarian reserve, we can counsel you to optimize your fertility and assist you, if necessary, by making use of the eggs that you previously vitrified. You will therefore have the chance to become pregnant at 40 years of age or more using the eggs stored when you were younger.

4

Make a donation

If you decide that you do not wish to use your eggs anymore, you could decide to donate them to somebody you know, at our anonymous egg bank or donate them to science.

FEES
